What Broke and How It Was Fixed?

The original layout used a hard-coded 960px container, so on any screen narrower than 960px the entire page overflowed horizontally and required sideways scrolling. The hero section had a fixed 460px text block and a 440px image sitting side by side, which meant they never stacked on small screens and the image was simply cut off. The three content columns were each set to a fixed 300px width, so on a narrow viewport they spilled outside the container instead of wrapping or resizing.

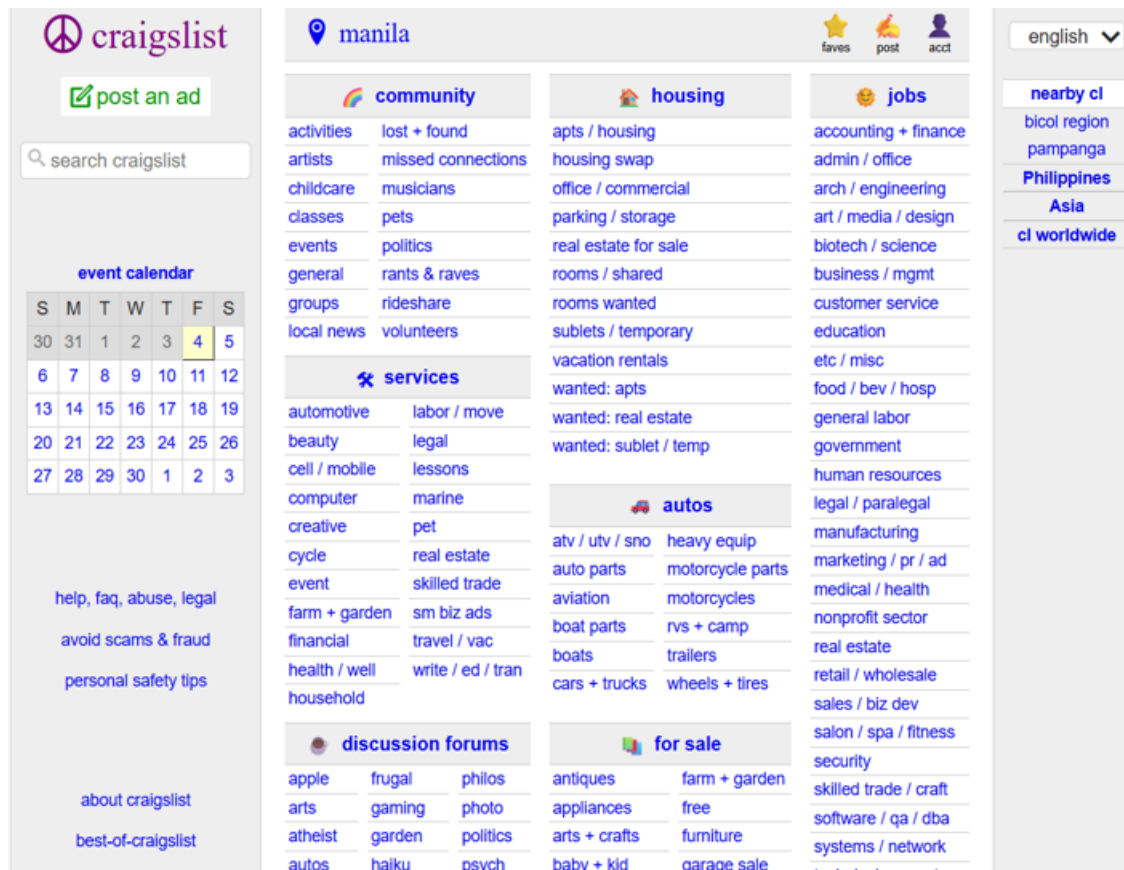

To fix these issues, the container was changed from `width: 960px` to `max-width: 60rem` with `width: 100%`, letting it shrink fluidly on smaller screens. All fixed pixel widths were replaced with relative units (`rem`, `%`, `flex`) so the layout stretches and shrinks proportionally, and a global `max-width: 100%; height: auto` rule was added to all images so they never overflow their container. Three media query breakpoints were added desktop (1025px+), tablet (481px–1024px), and mobile (up to 480px) each adjusting layout, font sizes, and spacing: the hero and content columns stack vertically on tablet and mobile, and the footer centers its content at every breakpoint. On mobile, the horizontal navigation was replaced with a hamburger menu button that toggles a full-width dropdown drawer, keeping the header clean and usable on small screens.

Part B. Redesign a Popular Website (Week 6)

Website

- <https://www.craigslist.org/area/manila>

Craigslist is famous for its "classic" design which prioritizes information density over modern responsive design. While they have mobile-specific versions (m.craigslist.org), viewing this specific desktop layout on smaller screens reveals several friction points.

1. Desktop View (1024px and above)

- **Status: Works Well.**
- **Observation:** This is the native intended view. The layout is a complex grid (likely using tables or floated divs).
 - **Left Sidebar:** The calendar and "post an ad" button are clearly visible and accessible.
 - **Main Content:** The three-column layout for categories (Community/Services/Forums on left, Housing/Autos/For Sale in middle, Jobs on right) utilizes the horizontal space efficiently.
 - **Right Sidebar:** The "nearby cl" links are tucked away neatly on the right.

- **Verdict:** High information density is achieved without looking too cluttered, thanks to the minimalist aesthetic.

2. Tablet View (approx. 768px - 1024px)

- **Status: Layout Shifts / Minor Breaking.**
- **What Worked:** The text remains legible. The "post an ad" button is still easily clickable.
- **What Broke:**
 - **Column Wrapping:** The main content area is too wide for a standard tablet portrait view. The "Jobs" column (far right of the center block) and the "Nearby CL" sidebar (far right of the page) will likely be forced to wrap to the next line.
 - **Visual Hierarchy:** As columns wrap, the visual relationship between categories (e.g., seeing "Housing" next to "Community") is lost. The page becomes significantly longer vertically.
 - **Header Crowding:** The top bar (Logo | Manila | User Icons | Language) becomes tight. The icons (faves, post, acct) might lose their labels or stack awkwardly.

3. Mobile View (approx. 320px - 480px)

- **Status: Significant Breaking (if not redirected to mobile site).**
- **What Worked:**
 - **Text Contrast:** The high contrast (black text on white/light gray background) remains readable even when zoomed out.
 - **Link Targets:** The blue underlined links are distinct, though the touch targets (padding) are very small, leading to "fat finger" errors.
- **What Broke:**
 - **The Calendar (Major Issue):** The "event calendar" is an HTML table (<table>). Tables do not wrap content. On a mobile screen, the days (S M T W T F S) and the dates will likely cause a horizontal scrollbar to appear, breaking the page width and forcing the user to scroll sideways just to see the dates.
 - **Single Column Stack:** The entire 3-column category layout collapses into a single vertical list. The user has to scroll through "Community," then "Services," then "Discussion Forums," then "Housing," etc. It becomes an endless list of links.
 - **Header Layout:** The top navigation bar (Logo, Location, Icons) will likely stack vertically or overlap, making the "Manila" location hard to find or the language selector hard to reach.
 - **Search Bar:** The search bar in the left sidebar might become too narrow to type comfortably in.

₱1,000,248 · 833 ft² · 3h ago

CEBU

54-seat co-working space for lease in Lapu-Lapu City, Cebu

₱324,000 · 1000 ft² · 3h ago

GROUP CONCLUSION

- **One thing the site does well**
 - The redesign excels at Visual Hierarchy and Grouping. By replacing the dense, text-heavy lists of the original Craigslist (Image 1) with distinct cards, icons, and rounded corners (Images 2-4), the new design makes it much easier for users to scan and identify categories. The grouping of sub-items (e.g., "Apts," "Rooms" under Housing) within the cards provides immediate context without cluttering the interface.
- **One responsiveness problem found**
 - There is a significant inconsistency in the Search Bar placement and prominence.
 1. **Mobile/Tablet (Images 2 & 3):** The search bar is a large, full-width element at the very top of the page, making it the primary focus.
 2. **Desktop (Image 4):** The search bar is relegated to a narrow input field inside the left sidebar. Since searching is the primary function of a directory site, shrinking and moving this critical element to the periphery on larger screens is a usability regression.
- **One improvement you recommend**
 - **Standardize the Search Experience.** Move the search bar to the main header area (centered or top-right) for the Desktop view, matching its prominence in the mobile view. Alternatively, if the sidebar layout is necessary, make the search input significantly wider and more visible within that sidebar.
- **Why your redesign is better**
 - The redesign transforms a utilitarian, dated interface into a modern, mobile-first experience.
 1. **Readability:** It solves the "wall of text" problem of the original site by using whitespace and typography effectively.
 2. **Touch Targets:** The card-based layout provides large, easy-to-tap areas for mobile users, whereas the original site's text links are prone to "fat finger" errors.
 3. **Aesthetics:** The use of icons and a clean color palette create a more trustworthy and professional feel compared to the stark, hyperlinked list of the original.
